

Dear Sir or Madam,

I'm applying for the Full Stack Engineer role at Avelios Medical because I'm motivated by building reliable, high-impact software in environments where quality, security, and usability truly matter.

As Co-founder and CTO of WD AI, I built and scaled a profitable AI platform from scratch to over 200,000 users with around 900 concurrent sessions. I led the full-stack architecture, developed TypeScript-based services, and designed backend systems focused on reliability, security, and maintainability. Working end-to-end—from design to deployment—gave me strong ownership over production systems and a deep understanding of how to operate software in critical contexts.

At QC Design, I developed high-performance Python and C++ systems with custom bindings, achieving over 10,000× speedups. I worked extensively on testing, benchmarking, and long-term maintainability, reinforcing my focus on correctness and clean engineering practices—essential for software used in sensitive environments.

Earlier at Huawei, I contributed to complex frontend and backend systems using React and REST APIs, strengthening my ability to collaborate closely with designers, engineers, and product teams.

Across my roles, I've built large-scale systems, taken responsibility for quality and delivery, and continuously improved development processes. I'm eager to apply this experience to help Avelios advance data-driven healthcare.

I'm proactive, highly motivated, and excited about contributing to your mission. I look forward to hearing from you.

Yours truly,

Ivan Ogloblin
