

Dear Sir or Madam,

I'm applying for the Full Stack Software Integration Engineer role because it combines what I care most about: building reliable systems, owning them long-term, and solving real security and compliance problems at scale.

As Co-founder and CTO of WD AI, I built and operated an LLM-powered SaaS platform from the ground up, growing it to over 200,000 users with around 900 concurrent sessions. I designed backend APIs, data pipelines, and cloud infrastructure, and built React and TypeScript frontends that integrated tightly with these services. I was responsible not only for development, but also for performance, security, monitoring, and continuous improvement.

At QC Design, I developed high-performance Python systems with strong focus on architecture, testing, and long-term reliability. This experience strengthened my approach to building software that is robust, well-documented, and maintainable under real operational constraints.

Across my roles, I've worked end-to-end on complex systems, collaborated closely with product and engineering teams, and taken full responsibility for what I ship. I enjoy turning ambiguous requirements into clean, scalable solutions and continuously improving them over time.

I'm ambitious, highly motivated, and excited about contributing to Siemens' cybersecurity mission. I'm looking for a place where I can grow, take ownership, and build systems that matter.

Yours truly,

Ivan Ogloblin
